The Guide for the Care and Use of Laboratory Animals provides a framework for the judgments required in the management of animal facilities--a resource of proven value, now updated and expanded. Invasiveness reduction methods are available in almost every area of biomedical research, and in project design, it is important to identify and use these methods wherever possible. As noted previously, narcotics can cause severe convulsions in cats and should be avoided.

Keeling, University of Texas M. Therefore the comments that follow will address only broad issues with some specific examples for the purpose of clarification. Three other commonly used inhalation agents are halothane, isoflurane and methoxyflurane. Refinement means any decrease in the incidence or severity of in-humane procedures applied to those animals which still have to be used.

There are two classes of barbiturates: They are also very sensitive to barbiturates. When surgery involves the head and face, there is limited access to the animal so the anesthetic protocol should be planned to facilitate monitoring under these circumstances.
